

In the Claims:

Kindly rewrite the claims to read as follows:

1. (Currently Amended) Format selector device for a wiping-material dispensing ~~appliances, the appliance, the appliance being of the type~~ comprising a housing with lateral flanges, between which are arranged a drum receiving a cutting blade, a reel of materials, a pressing roller or a guide roller, ~~characterized in that wherein~~ the format selector device makes it possible to control a dispensing of formats ~~(A1—A2)~~ of strips of materials in a ratio of one to two, ~~the position of the format selector device allowing the emergence of the cutting blade from the drum at each revolution of the drum for the a~~ small format and every two revolutions of the drum for ~~the a~~ large format, the selector device acting and causing a relation between a set of pinions (P1, P2, P3, P4, P5, P6, P7) meshing with one another in ~~the a~~ small-format dispensing situation, and some pinions (P2, P3, P7) being disengaged punctually over a drum revolution in large-format dispensing and cancelling ~~the emergence of the cutting blade from the drum, and in that~~ the selector device is positioned, from ~~one of the flanges (1) a lateral flange~~ of the housing, on ~~the an~~ outside and on ~~the an~~ inside of the ~~latter housing~~, and ~~in that it~~ comprises an operating lever (23) including two fixed stops (24—25) spaced apart and arranged on the flange (1), at the same time defining an angular spacing α corresponding to ~~the a~~ tilt of ~~the a~~ lever in ~~the an~~ upper or lower part, depending on ~~the a~~ selected format, and ~~in that~~ the tilt of ~~the said~~ operating lever acts with an axial push on a pusher member (12) guided on a hub (11) receiving two pinions (P1—P2) set up according to an axis Y, and ~~in that~~, by ~~specific means of the function of position of the said lever~~, the pusher member (12) causes connection between the pinions (P2 and P3) and therefore emergence of the cutting blade at each revolution of the drum or retraction of the pinion (P3) and the emergence of the cutting blade once every two ~~times~~ revolutions.

2. (Currently Amended) Format selector device according to Claim 1, ~~characterized in that wherein~~ the pinion (P2) cooperates by meshing with a pinion (P3) mounted on a retractable flap and according to an axis W, and ~~in that the said pinion (P1) cooperates with a pinion (P5) associated with a pressing roller, and in that the pinion (P7) is arranged at the end of the drum receiving the cutting blade and cooperates with the said pinion (P3).~~

3. (Currently Amended) Selector device according to Claim 2, ~~characterized in that the wherein a~~ hub (11) integral with the flange (1) and projecting internally from the ~~latter flange~~ is arranged with an inner bore (11a) allowing the axial guidance of the pusher member (12) and receives rotatably, on its periphery, the pinions (P1- P2) secured to one another, and ~~in that the~~ pusher member (12) is profiled at its front end with a conical profile capable of cooperating with the operating lever and at ~~the an~~ other end (12b) with a conical profile extended by an appendage (12e) so as to be accommodated in an orifice (14e) formed on a guide cap (14) integral with the said pinion (P1).

4. (Currently Amended) Selector device according to ~~either one of Claims Claim 2 and 3, characterized in that wherein~~ the pinion (P1) is arranged so as to receive a guide cap (14) allowing the axial displacement of the pusher member (12) and the radial displacement of two profiled cams (15—16) in ~~the a~~ inner volume (V1) of the said cap, forming a guide track, this taking place counter to an elastic retaining and return means (17), and ~~in that the~~ pinion (P1) is arranged with an oblique window (18) allowing the passage and, in some situations, the projection of ~~the an~~ end of one of the cams so as to come into contact with and push on the pinion (P3) for the purpose of retracting the ~~latter pinion (P3)~~.

5. (Currently Amended) Selector device according to Claim 4, ~~characterized in that wherein~~ the cams (15—16) are arranged on either side of the ~~other end (12b) of the~~ pusher member (12) and have an oblique profile (15a—16a) for cooperating with the said ~~other end~~.

6. (Currently Amended) Selector device according to ~~any one of Claims Claim 2 to 5, characterized in that wherein~~ the flange (1) has on the outside a projecting shape with three zones (10a—10b—10e) defining internally cavities for receiving the components of the said device and drum and pressing roller parts, ~~the shape (10a) a first zone of said zones~~ receiving the hub (11) and its pusher member (12) and having in its lower part a window-forming cutout (10a1) for receiving an elastically retractable flap (19) carrying a supporting shaft (20) of the pinion (P3).

7. (Currently Amended) Selector device according to Claim 4, ~~characterized in that~~wherein the pinion (P3) is arranged on its inside with a projecting stop (21) cooperating with ~~the an end of the a first cam (15) of said two profiled cams~~ when the ~~latter said first cam~~ is stressed in terms of radial displacement under ~~the~~ action of the pusher member (12) stressed by the operating lever.

8. (Currently Amended) Selector device according to Claim 6, ~~characterized in that~~wherein the flange (1) has a second cylindrical zone of said projecting shape (10b) ~~with having a~~ central orifice allowing ~~the a~~ shaft of the pressing roller to be received, ~~the a~~ depth of ~~the a~~ cavity of this ~~shape second zone~~ being such that the pinion (P5) positioned on the pressing roller is capable of meshing with the first pinion (P1).

9. (Currently Amended) Selector device according to ~~either one of Claims Claim 6 and 8~~, ~~characterized in that~~wherein the flange (1) has a third cylindrical zone of said projecting shape (10c) with an axis X corresponding to ~~the an~~ axis of the drum receiving the cutting device, ~~the a~~ depth of ~~the a~~ cavity of the third zone being such that a pinion (P7) arranged on the drum and designed as comprising a toothed quadrant with four teeth is capable of meshing with the pinion (P3).

10. (Currently Amended) Selector device according to Claim 9, ~~characterized in that~~wherein the drum has, on ~~the a~~ supporting shaft of the pinion (P7), a pinion (P8) ~~capable of~~ cooperating with a pinion mounted at ~~the an~~ end of the cutting-blade support in order to ensure the emergence of the blade.

11. (Currently Amended) Selector device according to Claim 9, ~~characterized in that~~wherein the drum has a pinion (P6) capable of meshing with ~~the a~~ pinion (P4) set up on the pressing roller.
